Long term, **optomap**<sup>®</sup> supporter with five devices in his practice group, Steve Rice, OD is also a firm believer in the advantages that **optomap** brings to clinical insight, decision making, documentation, and patient education.

“This is an enormously important tool in our treatment and monitoring of patients with diabetes. We are able to show these patients how diabetes affects their body by showing them the changes in the retina. It makes a big impact,” he says.

The doctors at the practice also let patients with diabetes or those at risk for macular degeneration know that the practice will store **optomap** images so that the result can be compared year over year, allowing doctors and patients to track any changes.

“When we superimpose one image over another and show patients how something has changed, that’s very powerful,” he says. It is another reinforcing message to return to the practice for annual exams. Dr. Rice says that he would like to see **optomap** imaging of all patients with diabetes.
